ASSIGNMENT-1

SAMEER KENDAL-EE22BTECH11044

Question: Suppose the equation of AB,BC and CA are respectively given by

$$\mathbf{n}_i^{\mathsf{T}} \mathbf{x} = c_i \qquad i = 1, 2, 3. \tag{1}$$

The equation of respective angle bisector are then given by

$$\frac{\mathbf{n}_{i}^{\mathsf{T}}\mathbf{x} - c_{i}}{\|\mathbf{n}_{i}\|} = \pm \frac{\mathbf{n}_{j}^{\mathsf{T}}\mathbf{x} - c_{j}}{\|\mathbf{n}_{i}\|} \qquad i \neq j$$
 (2)

Substitute numerical values and find the equations of the angle bisectors of A, B and C.

Solution: Using the (1) to calculate the normal equations of AB,BC and CA:-

$$AB: \mathbf{n}_1^{\mathsf{T}} \mathbf{x} - c_1 = \begin{pmatrix} 7 & 5 \end{pmatrix} \mathbf{x} - 2 = 0, \tag{3}$$

$$BC: \mathbf{n}_{2}^{\mathsf{T}} \mathbf{x} - c_{2} = \begin{pmatrix} 11 & 1 \end{pmatrix} \mathbf{x} + 38 = 0,$$
 (4)

$$AB : \mathbf{n}_{1}^{\mathsf{T}} \mathbf{x} - c_{1} = \begin{pmatrix} 7 & 5 \end{pmatrix} \mathbf{x} - 2 = 0,$$
 (3)
 $BC : \mathbf{n}_{2}^{\mathsf{T}} \mathbf{x} - c_{2} = \begin{pmatrix} 11 & 1 \end{pmatrix} \mathbf{x} + 38 = 0,$ (4)
 $CA : \mathbf{n}_{3}^{\mathsf{T}} \mathbf{x} - c_{3} = \begin{pmatrix} 1 & -1 \end{pmatrix} \mathbf{x} - 2 = 0.$ (5)

Using the (2) to calculate the angle bisector of angle C :-

$$\frac{\mathbf{n}_{i}^{\mathsf{T}}\mathbf{x} - c_{i}}{\|\mathbf{n}_{i}\|} = \pm \frac{\mathbf{n}_{j}^{\mathsf{T}}\mathbf{x} - c_{j}}{\|\mathbf{n}_{j}\|}$$
(6)

Internal angular bisector can be evaluated by taking '+' sign in the above equation. Taking i = 2 and j = 3 : -

$$\frac{\mathbf{n}_2^{\mathsf{T}}\mathbf{x} - c_2}{\|\mathbf{n}_2\|} = \frac{\mathbf{n}_3^{\mathsf{T}}\mathbf{x} - c_3}{\|\mathbf{n}_3\|} \tag{7}$$

$$\frac{\begin{pmatrix} 11 & 1 \end{pmatrix} \mathbf{x} + 38}{\sqrt{\mathbf{n}_2^{\top} \mathbf{n}_2}} = \frac{\begin{pmatrix} 1 & -1 \end{pmatrix} \mathbf{x} - 2}{\sqrt{\mathbf{n}_3^{\top} \mathbf{n}_3}}$$
(8)

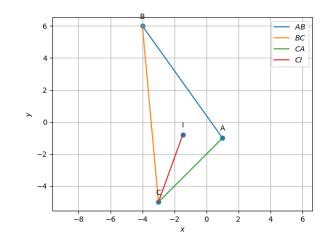

Fig. 0. Triangle generated using python

$$\Rightarrow \frac{(11 \quad 1)\mathbf{x} + 38}{\sqrt{(11 \quad 1)\binom{11}{1}}} = \frac{(1 \quad -1)\mathbf{x} - 2}{\sqrt{(1 \quad -1)\binom{1}{-1}}}$$

$$\Rightarrow \frac{(11 \quad 1)\mathbf{x}}{\sqrt{122}} - \frac{(1 \quad -1)\mathbf{x}}{\sqrt{2}} = \frac{-2}{\sqrt{2}} - \frac{38}{\sqrt{122}}$$

$$\Rightarrow \left(\frac{11 - \sqrt{61}}{\sqrt{122}} \quad \frac{1 + \sqrt{61}}{\sqrt{122}}\right)\mathbf{x} = -\frac{2\sqrt{61} + 38}{\sqrt{122}}$$
(11)

Hence, the (11) is the equation of internal angular bisector of angle C.
